Prevention

Cleaning walk-through areas: Soiling a carpet floor must be prevented right from the start by creating sufficiently large clean walk-through areas at the entrance and in problem areas (transition areas from hard surfaces to textile coverings/from production environments to administrative areas, etc.). You will achieve the best results by placing different mats, coarse and fine. It is absolutely essential to clean these mats every day otherwise, these dirt prevention mats may become a source of dirt themselves. This "ink pad" effect can also arise from improper use of wax-containing products in the daily care of hard floors.

Dusting of textile coverings

For daily cleaning of this carpet, please use a vacuum cleaner with a smooth nozzle. In order to keep the carpet attractive for many years, it is recommended to remove stains and spots independently to the regular cleaning.

Stain Removal (Detachur)

The earlier the stain treatment the higher the chances to remove it! Detachur comprises locally limited treatment of stains and other contamination. According to RAL 991/A3, this treatment step belongs to the everyday general routine cleaning. If the stains are immediately treated with suitable detergents they can usually be completely removed without any problems. An exception to this rule are stains with bleaching or colouring effect which cannot be completely removed without affecting the surface.

Small and slight spots and stains can usually be removed with lukewarm water and an absorbent cloth made of white cotton.

It is even better to use off-cuts from the laid carpet. Do not rub the stain. Clean gently whilst moving from outside to inside, applying pressure. You can also use a microfibre glove as a mechanical aid. Stains treatable with solvents (chewing gum, paraffins, etc.) can be removed in dry condition without damaging the pile area with a non-sharp-edged object (spoon etc.). Remove the residual substance with an appropriate spot remover.

Prior to cleaning, always test stain remover in an invisible and/or inconspicuous spot.

The manufacturer bears no liability in case of improper treatment.

All chemicals applied to the carpet should be completely removed in order to avoid a fast return of the dirt.

Use no bleaching agents or bleach-containing products as they cause colours to fade or bleed.

Intermediate and/ or Surface Cleaning

Surface cleaning encompasses the cleaning of the upper layer of the entire pile surface. However, it is no substitute for the intensive cleaning routine which is only postponed. Always carry out a cleaning test irrespective of the cleaning method to be used.

The following methods are advisable:

Basic and/ or intensive cleaning

Under RAL 991/A3 an intensive cleaning routine encompasses the cleaning of the textile covering throughout the whole pile. The cleaning plan depends on the building type. Anyway, it must be carried out by a professional cleaning firm at least once a year.

Always carry out a cleaning test irrespective of the cleaning method to be used. Depending on the amount of dirt, it may be necessary to combine different cleaning methods. Floor quality, floor surface construction, laying method and allocated drying time are all important criteria for the choice of cleaning method. Please contact our cleaning partner stated at the end of this Cleaning and Care Guide.

Spray extraction

Remove the loose dirt with a counter-rotating brush roller machine.

Upon completion of the pre-treatment (Vordetachur), sprinkle a low-surfactant detergent onto the carpet. Rinse the loose dirt from the textile covering with the aid of a spray extraction machine by applying pressure and sufficient water quantity.

Important! Do not fill any detergents into the spray extraction machine!

- Rinse several times with clear water
- Minimum drying time is 24 hours
- Do not use this method on water-sensitive floors!
- Do not use this method on loose carpets!

Combined procedure

Remove the loose dirt with a counter-rotating brush roller machine. As soon as you are ready with pre-treatment (Vordetachur), rub a cleaning liquid into the carpet with the aid of a three-disk, single-disk or roller machine (use a low-surfactant detergent).

After a short exposure time, scavenge the loose dirt from the surface by means of a spray extraction machine with enough water and remove it with a vacuum cleaner in one continuous process.

Important Advice! – Use crystalline drying carpet shampoo and/or low-surfactant detergents for pre-shampooing.

- Do not re-fill spray extraction machine with detergent!
- Rinse several times with clear water
- Drying rarely takes less than 24 hours
- Do not use this method on water-sensitive floors!
- Do not use this method on loosely laid carpets!
